Reflection Report

To assess the usability and overall user experience of the Sports NZ app, we invited several participants aged 18 to 25 to take part in user testing. This group represents our main target audience. Participants completed a series of common tasks, such as browsing event information, exploring community features, viewing achievements, and managing account settings. During the testing, we observed how users interacted with the prototype and gathered their feedback on design, navigation, functionality, and overall experience. Participants generally rated the idea of combining sports with community interaction positively. Many users enjoyed exploring sports activities, connecting with others, and tracking their progress through the app. Most participants also felt the app's visual style matched the Sports NZ theme, featuring a friendly and vibrant interface that met the needs of the target audience. Several users specifically noted that the overall color scheme was impressive, creating a lively atmosphere for sports and community activities.

However, we identified some areas for improvement during testing. One of the main issues raised was readability. Many users thought the text size on some pages was too small, making it hard to read. Additionally, some participants pointed out inconsistent color schemes on certain pages. While some pages appeared complete and polished, others felt bare, which disrupted the overall experience and affected the app’s coherence. Beyond visual aspects, users provided substantial functional feedback. Many participants believed certain features needed to offer more information or options. Some users reported seeing functions and menus but could not take further actions, which made the app feel unfinished. For instance, participants expected to find account-related functions like privacy settings and password management, along with more detailed activity information, complete activity workflows, and more options for managing personal accounts. Another recurring issue during testing was the lack of interactive features in the prototype. Many participants tried clicking buttons, settings, and navigation items, but these elements didn’t connect to other pages at that time. Consequently, many users felt the prototype still looked like an incomplete product. This feedback highlighted that users have higher expectations for mobile applications than we initially thought. They wanted more than just good design; they wanted a complete navigation flow and interactive content.

Based on the feedback from user testing, we implemented several changes. To improve readability, we adjusted the font size and information hierarchy on multiple pages. We also reviewed the overall visual design, enhancing the consistency of fonts, colors, and interface elements to create a more unified brand image and visual style, making different pages look more coherent. After concluding user testing, we spent a significant amount of time improving the prototype’s functionality. We expanded account management features, adding several pages, including updates to main pages such as Home, Explore, Map, Social, and My. Many features that were previously visible but not actionable now have corresponding pages and content. These new features enable users to manage information more effectively and make the overall application closer to a real product. Besides account management features, we also developed content in other areas, including event-related pages, notification functions, route tracking, achievement pages, and confirmation screens. These new features allow users to perform more actions and better understand how the application works in real usage scenarios. We added more interactions and links between

pages, making the prototype more than just a simple display; it provides a more complete user experience. After these adjustments, the prototype shows significant improvement in completeness, interactivity, and usability.

This project taught us that designers and users often see things differently. Since team members were quite familiar with the application's structure and functions, many navigation methods and interactive flows seemed logical and intuitive to us. However, after observing user interactions, we found that some functions and flows were not as clear as we had thought. Many designs that seemed obvious were not necessarily easy for users encountering the application for the first time. Through these tests and feedback, we gained a more objective view of the issues, ensuring that future changes were based on real-world usage instead of just the design team's ideas. Additionally, this project made us realize the importance of repeated testing and modification. Many problems did not surface during the design phase and only emerged once users began using the application. By observing user reactions and gathering their input, we identified areas for improvement, incomplete features, and truly valuable content for users. This feedback allows the prototype to develop gradually rather than stay at an initial stage.

In conclusion, user testing significantly impacts the final product of the Sports NZ prototype. The feedback we gathered during testing directly influenced subsequent changes and design decisions, helping us understand what users truly value. Given more time in the future, we hope to continue optimizing existing features, expanding content, and inviting more users from diverse backgrounds to participate in testing, further improving the app's completeness and user experience. For this project, we used ChatGPT to help generate visual inspiration and early concept development. All AI-generated content was reviewed, modified, and adjusted by the team before being included in the final design.

Documentation

Screenshots of iterations and version history.

1.

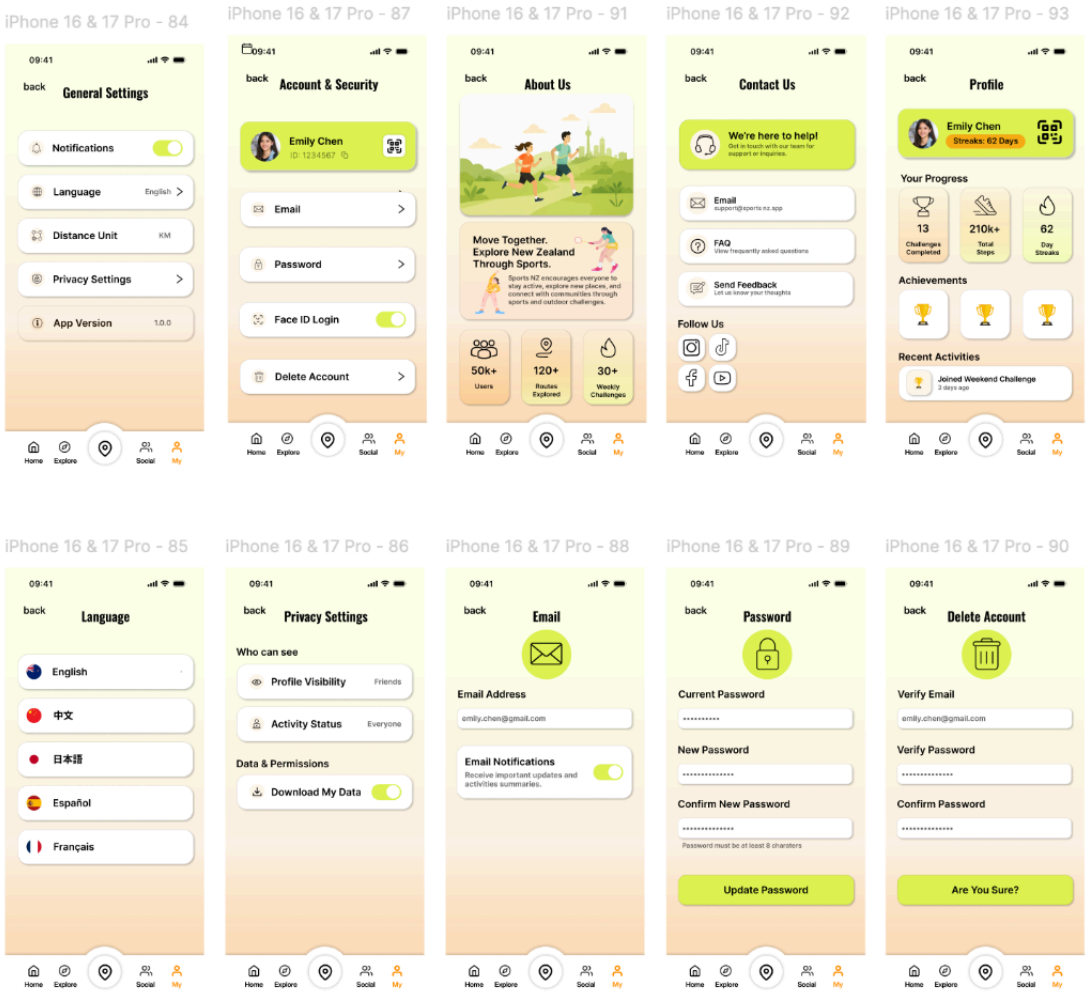

Figure 1. Initial settings expansion after user testing

Following usability testing, we identified that the original “My” page contained several menu items, such as General Settings, Account & Security, About Us, and Contact Us, that were not connected to any destination screens. Participants reported that the prototype felt incomplete and that many expected settings functions were missing. To address this issue, an initial set of settings and account management pages was created, including Language, Privacy Settings, Email, Password, Profile, About Us, and Contact Us pages.

2.

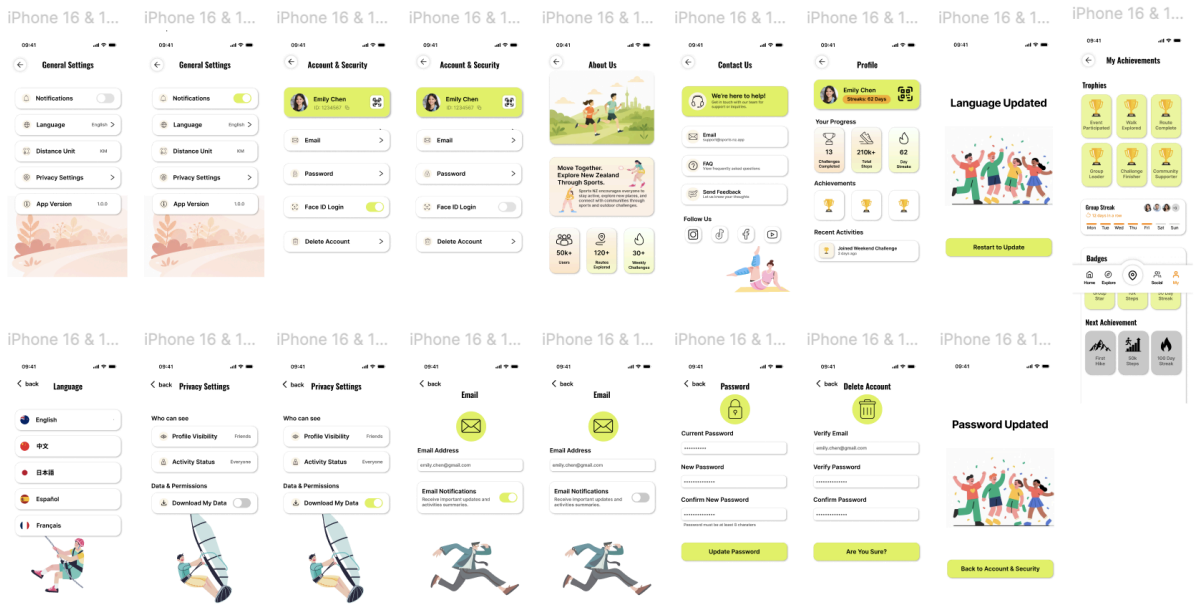

Figure 2. Refined and expanded settings prototype

After the first iteration, additional improvements were made to increase functionality and interactivity. More account management options, confirmation screens, and navigation links were added to create a more realistic user experience. These changes improved navigation flow and allowed users to complete common account-related tasks within the prototype.

3.

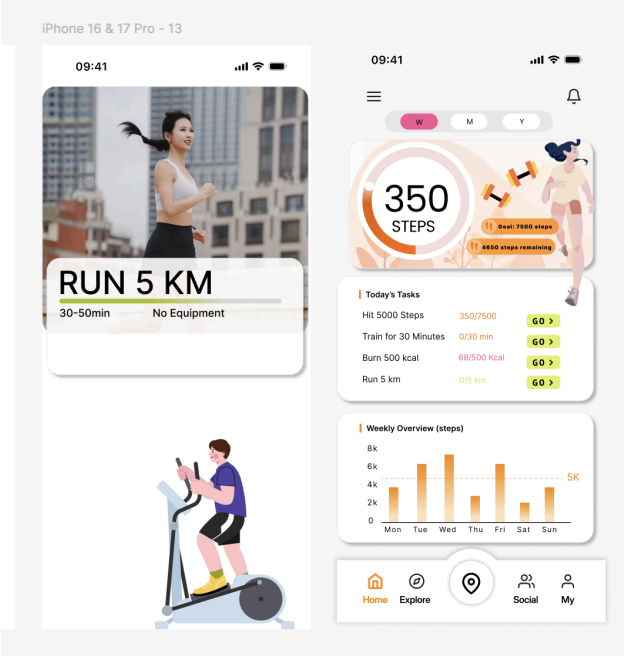

Figure 3.Home dashboard and workout preview screens showing the app's main activity overview.

This figure shows the main home dashboard and a workout preview screen of the fitness app. The home page presents the user's current step count, today's task list, and a weekly step overview, helping users quickly understand their daily activity progress. The RUN 5 KM preview screen uses a large photo card, workout duration, equipment requirement, and an exercise illustration to introduce the running task in a visually engaging way.

4.

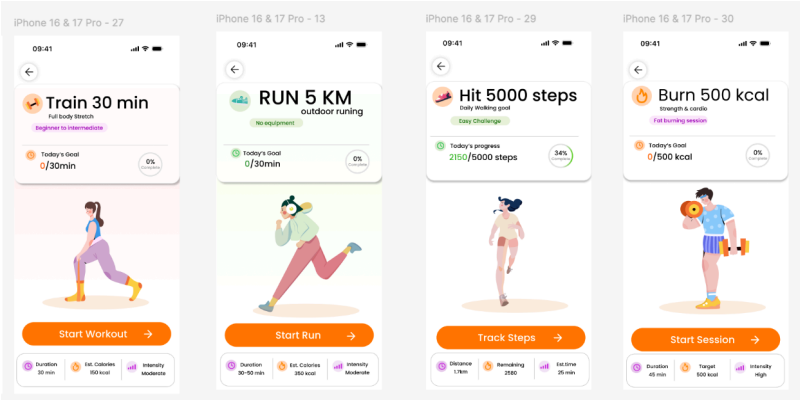

Figure 4.Four task detail pages showing different fitness goals and their start actions.

This figure shows four task detail pages for different fitness goals: Train 30 min, Run 5 KM, Hit 5000 steps, and Burn 500 kcal. Each page follows the same clean layout, including a goal card, progress indicator, main character illustration, action button, and key activity metrics at the bottom. This consistent structure makes it easy for users to compare tasks and start different types of workouts with minimal learning effort.

5.

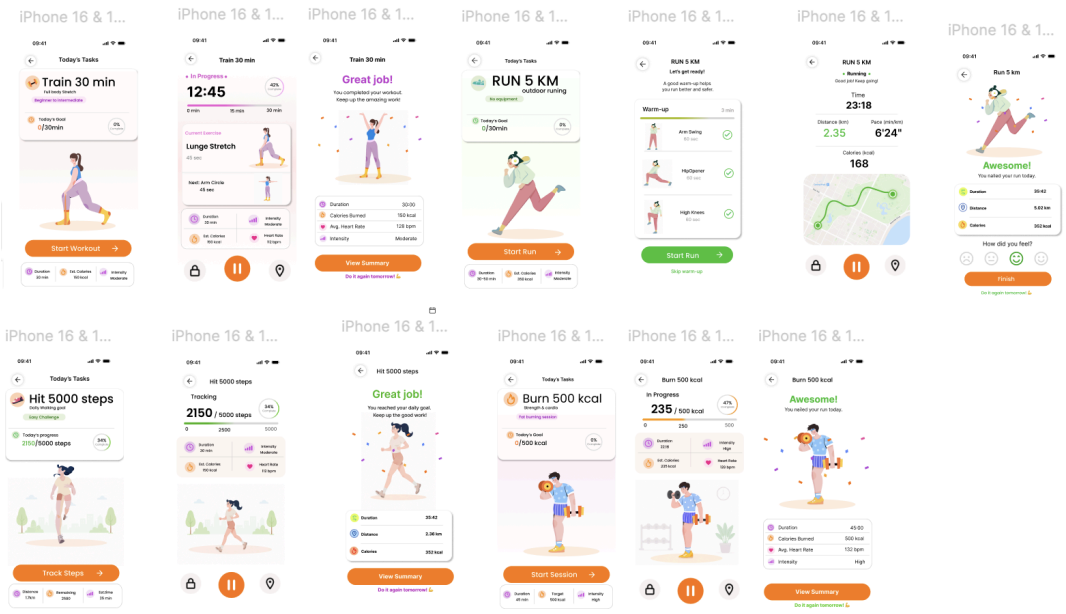

Figure 5. Complete prototype flow showing task start, progress tracking, completion summary, and connected smiley feedback interaction.

The prototype demonstrates how users interact with the app through simple tap actions. Users can tap Start Workout, Start Run, Track Steps, or Start Session to begin an activity. After entering the progress screen, users can view real-time data such as duration, distance, calories, heart rate, pace, intensity, and completion percentage. The pause button and bottom icons also provide clear control options during the activity.

The completion pages provide positive feedback, such as Great job! and Awesome!, along with a summary of the user's performance. A key update in this prototype is that the smiley feedback section is also connected. After completing a task, users can tap a smiley face to rate how they feel, making the experience more interactive and personal.

Overall, this prototype shows a complete and consistent user journey. The repeated layout structure, progress indicators, character illustrations, large action buttons, and connected feedback interaction help users understand their workout status clearly and move smoothly through the app.

6.

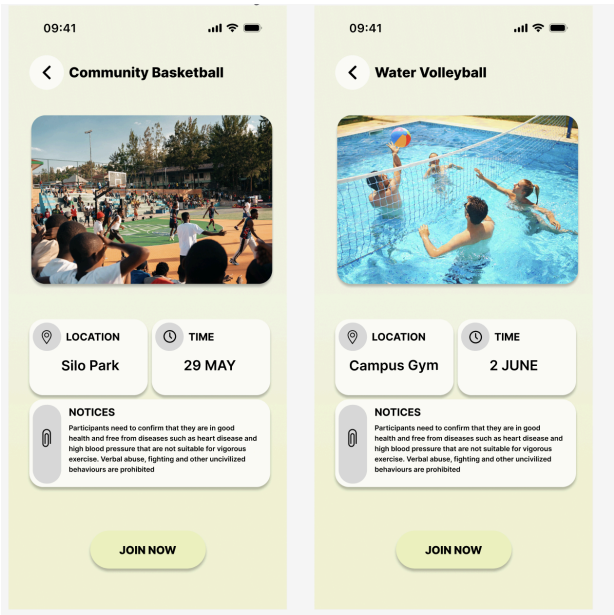

Figure 6. Initial events expansion after user testing

After listening to the user's suggestions, I found that the original explore page contained many clickable items. For example, there were "nearby events", "popular events," and "view all" in events. And I soon realized a point, there is also a lot of content to be included in events. There is not just one event, and each event also has its own detail page. Then users can choose to participate. This part involves a lot of content, so I decided to start working on it. The first time I designed it, I didn't think too much, which led to the entire page being very unattractive and having poor readability. Mainly, it didn't match the overall style of our page. It's not a very good page for users to choose from, either.

7.

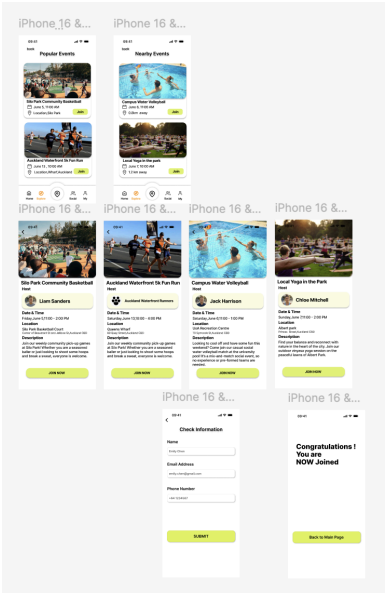

Figure 7. Refined and expanded events prototype

After identifying the shortcomings of the initial version, I quickly made adjustments. Through some trial and error, I first designed the two tabs for "Popular Events" and "Nearby Events", which significantly improved readability. On the "Nearby Events" browsing page, I specifically changed the location display to show the distance from the user. I conducted some case studies on sports suitable for the New Zealand local context and ultimately decided to feature these four as the main options. Tapping into any event allows users to view its details. After reading, users can choose to join or return to the previous page. When signing up, they also need to briefly fill in some necessary information. After repeated testing, this iteration was considered well-executed and aligned with the typical user flow when using the app.

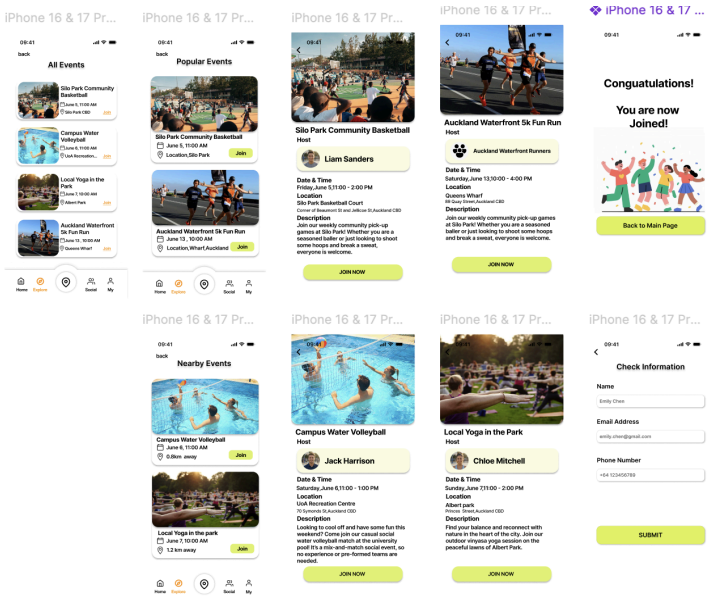

Figure 8.The final polished events prototype

When I returned to the home page to review, I realized that I had overlooked the "view all" option, which is also clickable. So I added this page. Since this page contains a relatively large number of different events, its layout differs from previous designs — the images are placed on the left. I also added small icons to the registration success page to polish it. Then I standardized the font for my part of the design. In some areas (such as the details page), different font weights are needed to distinguish primary from secondary information. The overall font size I used in this design is on the larger side because, during the user research phase, several users reported that the font was too small. Finally, I also refined some small details.

9.

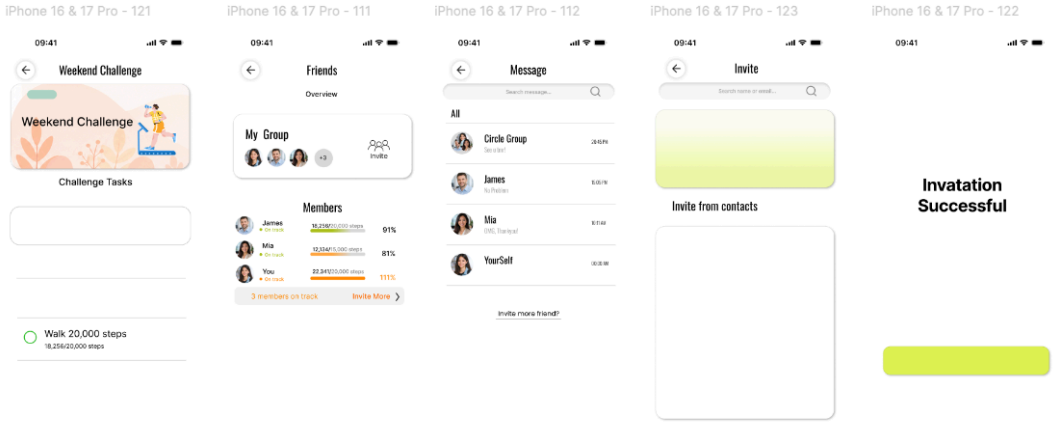

Figure 9. Initial Social / Friends and Family module showing the planned social interaction flow.

This is the initial idea for the Sports NZ prototype Social / Friends and Family module. The flow contains the Weekend Challenge page, Friends page, Message page, Invite page, and Invitation Successful confirmation screen. This module was designed to make physical

activity more social and less of a task for the individual. Users can not just monitor their own progress, but also participate in challenges with friends, see who is in their group, message others, and invite others to join the challenge.

The function of this is to boost motivation via social connection. With users able to see their friends' progress, send messages, and invite others to join, the app becomes more engaging and supportive. The invitation and confirmation screens also make the interaction feel more complete, as the user gets the feedback after he/she has performed an action. Overall, this module assists Sports NZ in promoting low-pressure group involvement and motivating users to keep moving together.

10.

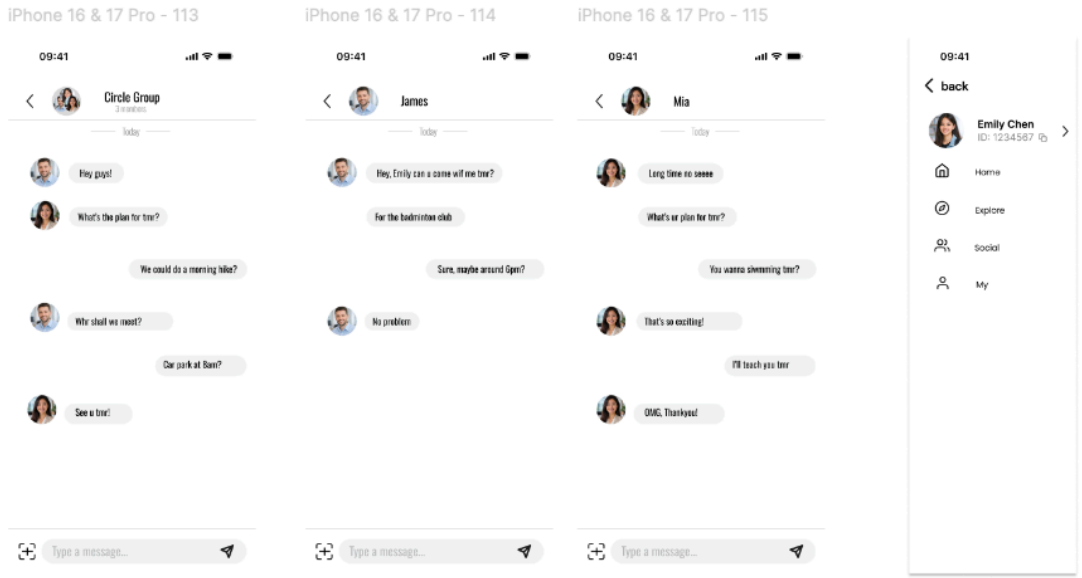

Figure 10. Message pages and side navigation screens show improved communication and app movement.

This is a view of the message pages and side navigation in the Social / Friends and Family module. The social function was made more detailed and realistic by adding the message pages. Users are not just limited to a friend's list, but can add conversations and chat with friends, as well as talk about activities. This makes the social module more interactive and provides users with a better motivation to come back to the app.

The side navigation screen was developed to assist the user in navigating between different sections of the app, such as Home, Explore, Social, and My. This helps the prototype to be more user-friendly as users can easily see where they are and where they can go next. Overall, the message pages and side navigation enhance the usability of the prototype, making the app feel more complete and integrated, and more like a real mobile application.

11.

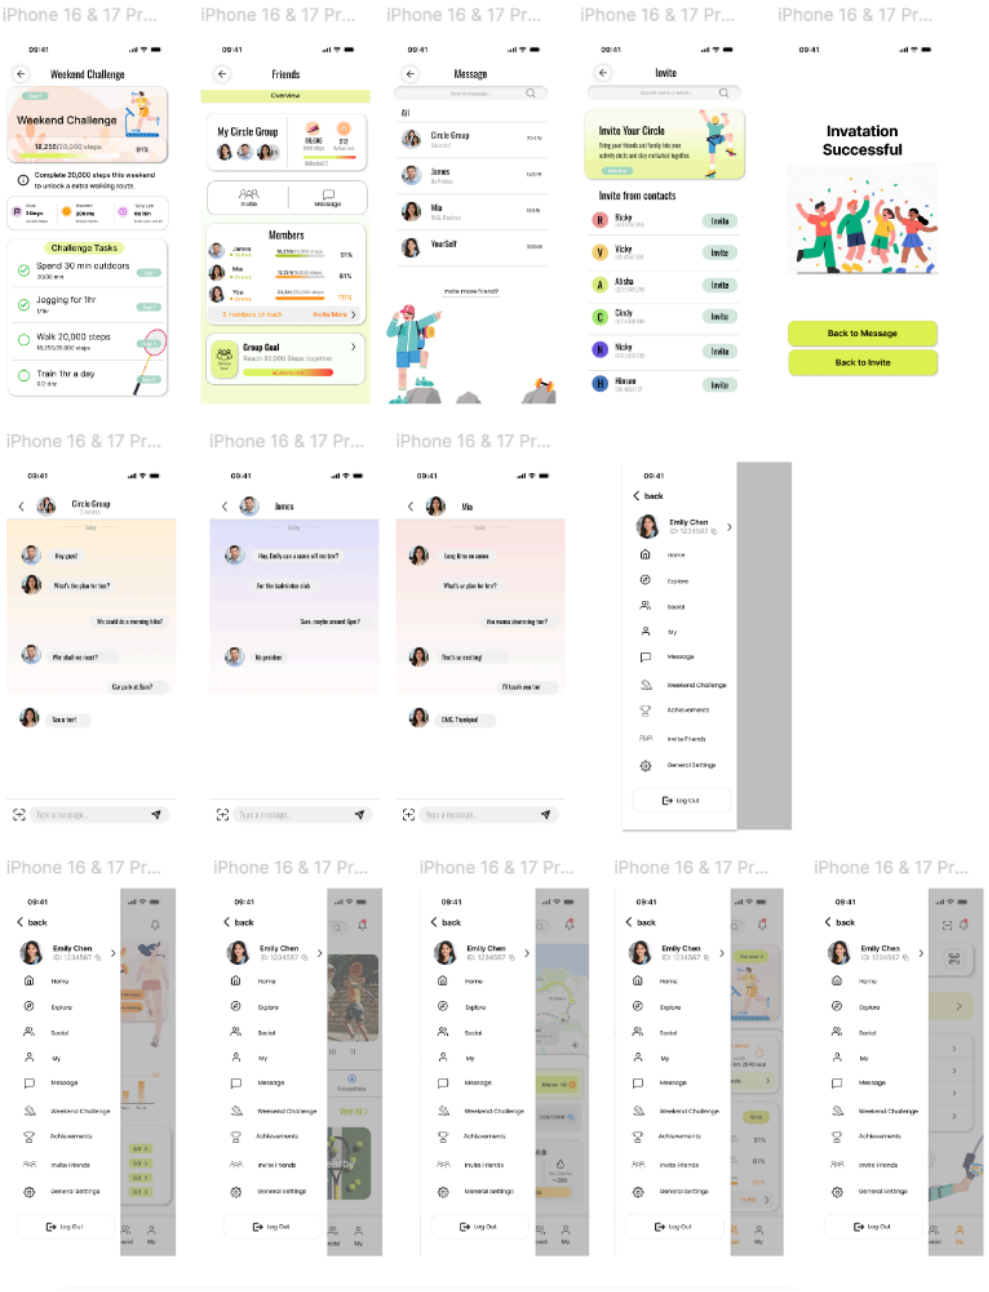

Figure 11. Final social module design for shared activity, messaging, and invitation.

The Social / Friends and Family module was developed for the final version of the app to make it more active and relationship-oriented. The previous concept was primarily about displaying basic group details and friend information. For the final version, I added more features to make it a more complete experience, including a weekend challenge, a progress tracker for groups, messaging with friends, an invitation to join groups, and a sidebar for navigating between the app sections.

This was a very important function as Sports NZ is not just about tracking exercise data. The app also hopes to make physical activity more manageable to keep going by engaging people the user is already familiar with. The challenge pages enable users to visualize shared goals, message pages provide a place to be encouraged and plan, and invite pages help the group expand. All these features provide the user with additional reasons to use the app other than checking the numbers.

For the social module, users can begin with a challenge, view who is participating, communicate with friends, invite others, and go back to other sections of the app. This adds a sense of fullness and enhances the interaction with the prototype. The final design is designed to achieve the goal of using social motivation to promote low-pressure, regular physical activity.

12.

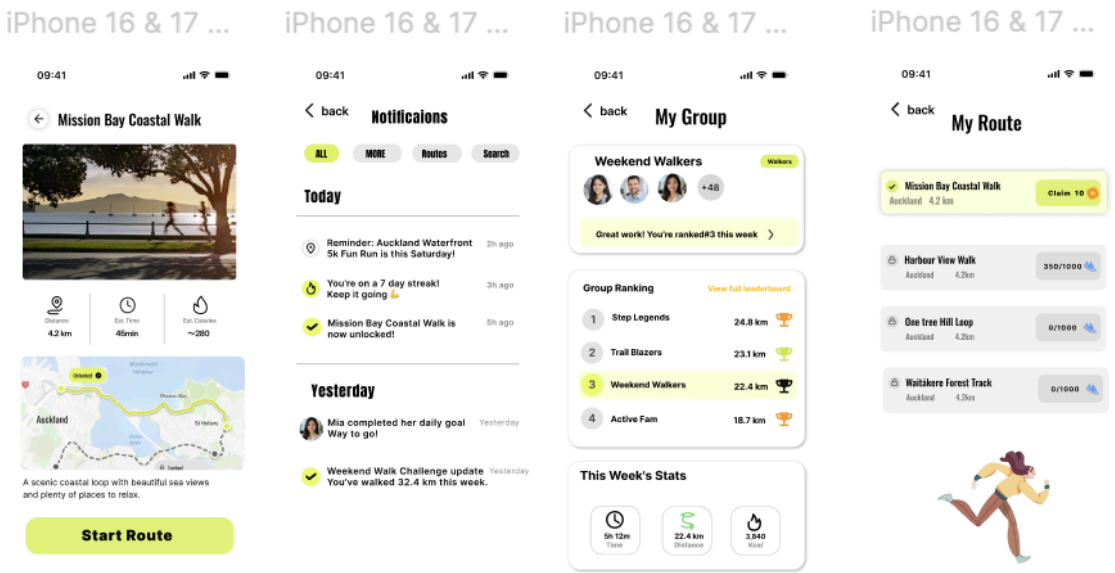

Figure 12. Route, notification, group ranking, and route management screens showing how the app supports activity tracking and social engagement.

The above diagram provides a brief overview of both the extended route functionality and social aspects provided by the Sports NZ app. The route details page helps the user get all the information necessary, such as distance, time estimation, number of calories, location on the map, and the description of the route before actually starting the workout. The notification page provides the user with timely updates regarding reminders, streaks, unlocking routes, and friend activity. The group page motivates the user to exercise through weekly rankings, group members, a leaderboard, and activity statistics. The route list page gives the user an overview of all the routes, along with the progress made on each one of them.
